

Chapter 14 – Normalization Examples

UTD CS-6360 Dr. Chris Irwin Davis

2NF, 3NF, and BCNF Normalization

- Normalization problems begin with a given relational schema and an associated set of Functional Dependencies (FD).
- For such problems you will be told to which level you are expected to normalize.
- Normalization problems must proceed in hierarchical order, each step must be completely normalized to that level before moving on to the next normal form.

4NF, and 5NF Normalization

- Problems normalizing 4NF and 5NF will also include a small ER diagram to disambiguate the schema semantics, i.e. to determine whether 4NF normalization or 5NF normalization is warranted.
- Problems normalizing 4NF and 5NF may also include a data set which must be mapped onto the normalized schema.

Format of Given Information

- Normalization problems may be presented in either one of two different representations. One is a graphic representation of a relational schema and its associated FDs, the other is a text-based representation of a relational schema and its associated FDs. The following two examples are *two different ways to represent the exact same schema and FDs*. Exercises 14.24 and 14.25 in the textbook are given in text format.

Graphic

Text

$R = \{A, B, C, D, E, F\}$

$FD = \{\{A, B\} \rightarrow \{C, D\}, \{B\} \rightarrow \{F\}, \{D\} \rightarrow \{E\}\}$, Set notation, or shorthand...

FD1 = $AB \rightarrow CD$

FD2 = $D \rightarrow E$

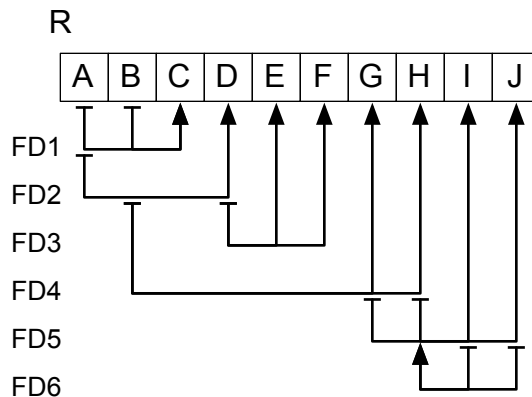

FD3 = $B \rightarrow F$

Chapter 14 – Normalization Examples

UTD CS-6360 Dr. Chris Irwin Davis

Consider each of the universal relation R below numbered 1–4, and each associated set of function dependencies. What is/are the key(s) for each R ? Normalize/decompose each R into 2NF, then 3NF, and finally BCNF relations. Clearly indicate each step, label all FDs, and label the primary key (PK) for each new decomposed relation.
